

These are not the only words that can be used in this cloze activity. If you have some different words feel free to send your version to me and I can check it for you!

Environmental Science is the study of the life processes of Earth and of how human activity affects these processes. Environmental Science has become very important in recent years because of the need to protect the natural and human environment for present and future generations. It is vitally important that our planet is protected from the negative impacts of human activities.

Environmental issues such as climate change, conserving biodiversity, management of waste and natural resources, production of energy and protecting human health are now high on the agenda of all governments, resulting in stricter rules and regulations. This in turn has created a greater need for knowledgeable and well - trained Environmental Scientists. Dealing with these current and future environmental issues requires an open mind and problem- solving skills.
